

K Disc for professional hoof trimming

The K disc was developed in close cooperation with professional hoof trimmers and assessed by discerning professionals. The K disc in clinical use has been shown to be invaluable by reducing the time taken to effect claw-cutting - resulting in a reduction of costs. The body of the disc is made of high-quality industrial plastic.

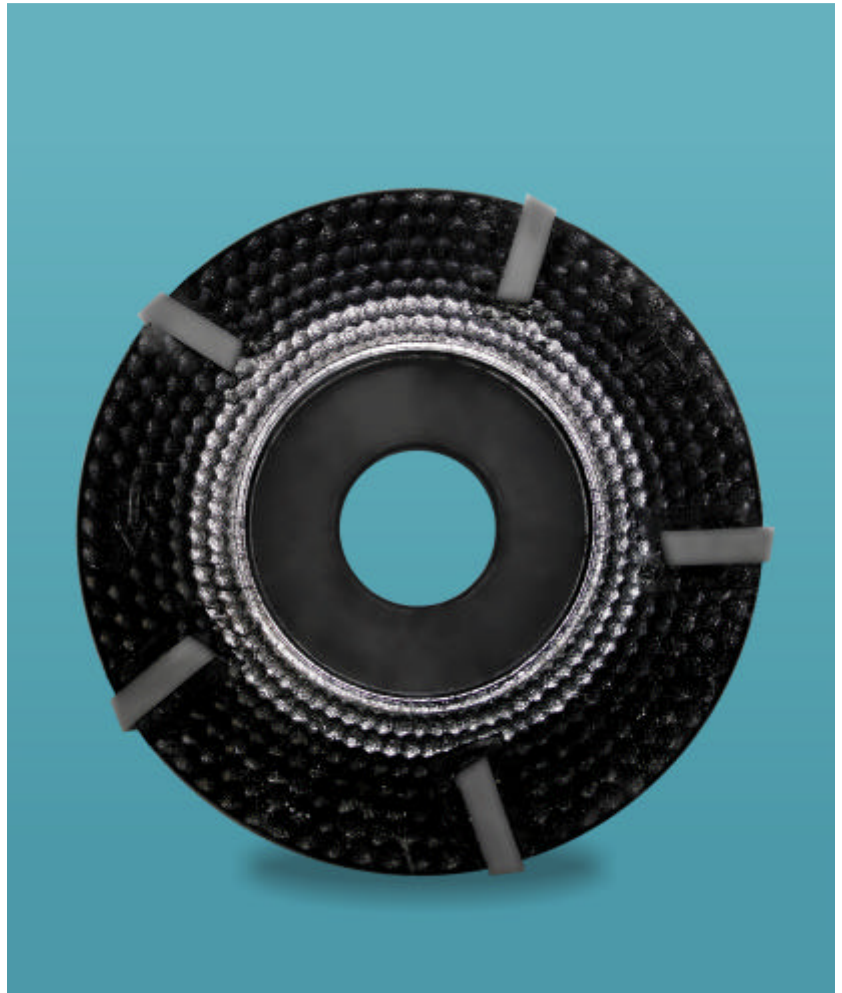

With this material choice the light disc runs in an amazingly smooth way and has an easy, convenient handling.

5 cutting blades constructed of durable hard metal (Widia) ensure a high level of horn removal and longevity. The blades are adjusted for fast trimming and removal of large cutting chips – without generation of heat, dust or smell.

Experience shows that up to 100 animals can be trimmed with one K disc. This value must be reduced when there are stones or sand on the surface of the claws.

The advantages of the K disc:

- Light weight
 - fast acceleration
 - easy handling
 - strong abrasion
- Extremely low vibrations
 - 5 blades placed in a row
 - is easy on user and machine
- Clear result which makes it easy to see defects
- No dust development – convenient for the user
- No heating up – preserves the animal
